ABSTRACT

The Kankakee–Lower Wabash River Basin is the fourth area to be assessed by the Office of Water Quality, Surface Water Assessment Branch under a 5-year, rotating monitoring strategy. The information obtained from this series of water quality studies is used in support of the biennial 305(b) Water Quality Report, which provides an assessment of the quality of Indiana’s rivers, streams, and lakes for designated uses. The computation of total stream miles within a waterbody (hydrologic unit) is necessary for an overall assessment, and is particularly important when a waterbody exhibits different designated support characteristics. This document contains a listing of the names, total stream miles, and confluence miles for the streams and tributaries in each 14-digit hydrologic unit within the Kankakee–Lower Wabash River Basin. This report is primarily intended as a support document for the 1999 305(b) Water Quality Report, but it will also serve as a support document for future assessments and other reference needs.

The following 8-digit hydrologic units were included in this analysis: 07120001, 07120002, 05120108, 05120109, 05120110, 05120111, and 05120113.

Mileages were obtained by staff through use of *ArcView* ® 3.1 Software with the *River Reach File (RF3-Alpha)* serving as the coverage.

INTRODUCTION

The Kankakee-Lower Wabash River Basin comprises the fourth area to be evaluated under the 5-year, rotating Surface Water Quality Monitoring Strategy (IDEM 1996). The information obtained from this series of water quality studies is used in support of the biennial 305(b) Water Quality Report, which provides an assessment of the quality of Indiana's rivers, streams, and lakes for designated uses. The computation of total stream miles within a waterbody (hydrologic unit) is necessary for an overall assessment, and is particularly important when a waterbody exhibits different designated support characteristics. This document contains a listing of the names, total stream miles, and confluence miles for the streams and tributaries in each 14-digit hydrologic unit within the Kankakee–Lower Wabash River Basin. This report is primarily intended as a support document for the 1999 305(b) Water Quality Report, but it will also serve as a support document for future assessments and other reference needs.

MATERIALS AND METHODS

Total stream miles and confluence miles for all fourteen-digit Hydrologic Unit Code (HUC) areas within the Kankakee-Lower Wabash River Basin were derived using the *Reach File Version 3.0-Alpha* (RF3) and *ArcView® 3.1* software. When the term "stream reach" is used in this document, it is defined as a stream segment between two confluences. Hydrologic Unit coverages at 1:24,000 were overlaid onto the *RF3-Alpha* coverage at 1:100,000 to calculate the total stream miles in each HUC.

There were several reasons the 1:100,000 *RF3-Alpha* coverage was used to calculate stream mileages:

1. The *RF3-Alpha* coverage was used by the US Environmental Protection Agency (USEPA) to randomly select sampling locations for the Watershed Monitoring Program (IDEM 1998) in the Kankakee-Lower Wabash River Basin;
2. The mileages used for the 305(b) assessments will be completed using the same coverage;
3. *The RF3-Alpha* coverage is recommended by the USEPA for state water quality assessments to achieve nationally consistent nomenclature for 305(b) reporting.

It is important to note that *RF3-Alpha* files have limitations. A full explanation of these limitations can be found in the RF3-Alpha technical reference (USEPA 1994). The rationales that were used to overcome these limitations are listed below:

- Unlike the 1:24,000 United States Geological Survey (USGS) topographical maps, original stream channels within reservoirs are not shown in *RF3-Alpha* files. The measuring tool within *ArcView®* was used to calculate stream mileages in these cases. The measurement was completed by traversing the *ArcView®* measuring tool through the middle of the channel. To

ensure precise measurements when using the *ArcView®* measuring tool, the stream reach was measured a second time. If the second value was within ± 0.1 miles of the first measurement, the first measurement was the accepted value.

- Stream names used in the *RF3-Alpha* files that agreed with names used on the USGS 1:100,000 planimetric maps were assumed to be correct. When a stream name was not given in the *RF3-Alpha* file, the stream name from the planimetric map was used. In the case that a name was not given in the *RF3-Alpha* file or on the planimetric map, or in the case that a name conflicted between the *RF3-Alpha* file and the planimetric map, the stream name used on the USGS 1:24,000 topographic map was consulted to determine which name would be used in the final report.
- In several watersheds, tributary streams did not converge with the main stem but formed into natural lakes. Unlike the reservoirs, no definable channels are shown through these areas; consequently, confluence miles were not included in these areas. Instead, total lake acres were included.
- The main stem linear mileages of the Wabash and Kankakee Rivers were measured similarly as the reservoirs due to their width. Mileages were traversed with the *ArcView®* measuring tool through the middle of the river channel. Due to the RF3-Alpha delineation of the Wabash and Kankakee River banks, the areas representing the mouth of tributaries were often considered part of the river. When this occurred, the most direct arc to the river proper was chosen to represent the lineal mileage value.
- The *RF3-Alpha* file has double lines representing the main stem of the Wabash and Kankakee Rivers. This caused problems when calculating confluence mileages. Stream reaches that are directly across from each other that converge on opposite sides with the main stem of these rivers should have similar confluence mile values. When the confluence mile values were different, the *ArcView®* measuring tool was used to traverse the distance from the previous known confluence mile. The measured distance was compared to both reaches, and the reach with the closest mileage value to the measured distance was selected and used to find the closest confluence. The distance to the opposite reach was found by using the *ArcView®* measuring tool.
- Several of the watersheds have streams that cross the Illinois state line. The confluences of the Kankakee and Iroquois rivers are in Illinois. To account for the confluence mile for tributaries to these and other western flowing tributaries, Illinois miles were determined and included into the confluence miles of their tributaries. There are also a few watersheds that have no *RF3-Alpha* records due to the crossover at the state line. These watersheds are listed as noncontributing.
- In some cases a name change within a particular stream reach was not recognized by the *RF3-Alpha* files. For example, the 1:24,000 map coverage may show a small intermittent stream

(not included on the *RF3-Alpha* coverage) separating two stream reaches. The stream name on the upstream side of the intermittent stream may be different than the name on the downstream side. The *RF3-Alpha* coverage did not recognize the intermittent stream separating the two stream reaches; thus, only one stream name was given. When this occurred, the name for the stream closest to the confluence was used for the combined reaches.

- The Hydrologic Unit coverage was digitized by USGS at a 1:24,000 scale. When this coverage was overlaid onto the 1:100,000 scale *RF3-Alpha* coverage, features did not always align properly. Questionable boundaries were determined to be located at the nearest confluence, where appropriate. Stream segments were split in areas where the HUC boundary crossed a stream that was not near a confluence to maintain consistent, relative sizes of the fourteen-digit HUCs.
- A specific waterbody name was assigned to each HUC. These names were derived from a list created by Natural Resources Conservation Service (NRCS), for the completion of a digital data set of fourteen-digit hydrologic units. As described previously, the HUCs were digitized at a 1:24,000 scale. The waterbody names in this report were used to describe streams that were included in the 1:100,000 scale *RF3-Alpha* coverage. When a stream name from the NRCS naming convention was not included in the *RF3-Alpha* coverage, another stream name was selected as the waterbody name to best describe the HUC.

RESULTS

Using the method outlined above, lineal mileage values and confluence miles were determined for all river and stream tributaries in the Kankakee-Lower Wabash River Basin. All main stem rivers and tributaries were calculated, totaled, and shown as part of the total miles for each 14-digit hydrologic unit. Results of the determinations are found in Appendices I-VII. Streams that converged into natural lakes were not given a confluence mile but were marked NA for "not applicable." Stream miles summarized by eight-digit HUC are listed in Table 1.

Table 1 Stream Miles by Eight-Digit HUC

HUC	River Basin	Stream Miles
07120001	Kankakee	2,670.61
07120002	Iroquois	843.12
05120108	Middle Wabash - Little Vermilion	2,237.68
05120109	Vermilion	130.51
05120110	Sugar Creek	842.41
05120111	Middle Wabash - Busseron	926.44
05120113	Lower Wabash	590.98
Total Miles		8,241.75
